Docket No. 03-8 FJA

2

AMENDMENTS TO THE CLAIMS:Please amend the claims as follows.

BEST AVAILABLE COPY

1. (Currently Amended) A structure for mounting a shift operation device on a vehicle body, comprising:

a support member having a first part comprising a notch to be fixed on the vehicle body, and a second part having an opening aligned with said notch to support said shift operation device so as to be dropped downwardly with the shift operation device when a larger load than that of a predetermined value is applied to said first part,

wherein said first and second parts are integrally formed into a single component, said shift operation device being mounted on the vehicle body via said support member so that the larger load than that of the predetermined value can break and drop the shift operation device.

2. (Previously Presented) The structure according to claim 1, wherein said first part is sandwiched on a front and a back thereof by said second part.

3. (Currently Amended) The structure according to claim 2, ~~said first part comprising a notch for downwardly inserting wherein~~ a mounting member is inserted in said notch for mounting said support member on said shift operation device, ~~[[;]] and~~

wherein said first part further comprises openings with a predetermined diameter disposed at both sides of said notch,

wherein a plastic material fills in said notch and said openings, and

wherein the plastic material filled in said openings breaks away when the larger load than that of the predetermined value is applied to said support member.

4. (Previously Presented) The structure according to claim 3, wherein a projection inserted into said notch is integrally formed at a portion of said first part around the notch.

5. (Previously Presented) The structure according to claim 3, wherein at least one of said openings has a hollow opening for filling with the plastic material, a positioning pin projecting from a side wall of said shift operation device is inserted into said hollow opening, and said positioning pin inserted into said hollow opening breaks away when the larger load than that of the predetermined value is applied to said support member.

6. (Previously Presented) The structure according to claim 4, wherein at least one of said openings has a hollow opening for filling with the plastic material, a positioning pin projecting from a side wall of said shift operation device is inserted into said hollow opening, and said positioning pin inserted into said hollow opening breaks away when the larger load than that of the predetermined value is applied to said support member.

7. (Previously Presented) The structure according to claim 3, wherein said second part comprises said plastic material; and
